

YUNO × HEALTHBRIDGE GLOBAL

Deal Strategy & Commercial Proposal Package

Winning the \$420M TPV payments decision before the PayU renewal clock runs out

\$420M annual TPV, 14 countries	72% blended approval rate today	\$15.6M recoverable payment volume / yr (modelled)	89 days to PayU contract expiry
---	---	---	---

Prepared by Dean Farley · Senior / Strategic Account Executive, Yuno

29 July 2026

How this document is structured

Part A — Internal deal strategy (Yuno eyes only). Deal qualification with a MEDDICC scorecard, a four-layer read on each stakeholder with tactical-empathy scripting, prepared objection handling, and the 90-day plan to close before the renewal deadline. Covers required sections 1, 2, 4 and 5.

Part B — Commercial proposal (HealthBridge-facing). Written as it would be presented to Sofia, Marcus and David: the pain, the outcome, the benchmark-anchored financial impact model, and Yuno's pricing. Covers required section 3.

One rule holds everywhere: Yuno is an agnostic orchestration layer, not a PSP or acquirer. The only pricing quoted anywhere in this package is Yuno's own platform fee. All acquiring economics remain between HealthBridge and its providers.

Deal Strategy

MEDDICC · tactical empathy · competitive positioning · 90-day execution

1. Deal Qualification & Strategic Assessment

The deal in one paragraph

HealthBridge processes \$420M of patient payments a year across 14 countries at a 72% blended approval rate, against domestic-market benchmarks in the high 80s. Their VP of Payments estimates \$18M a year is leaking through declines. Their PayU contract dies in 89 days, Adyen is pitching consolidation through the Head of Engineering, and the CFO has set a 20% cost-reduction bar he hasn't yet tested against anyone's numbers. The pain is real, quantified by the customer themselves, and time-boxed. That is as good as inbound gets.

MEDDICC scorecard

Element	Status	Read
Metrics	STRONG	Customer-quantified: \$18M/yr decline leakage, 68% Brazil approval vs 74% six months ago, \$14.8M processing cost, 20% CFO savings bar. We inherit their numbers – strongest possible position.
Economic buyer	GAP	David Park (CFO) – unengaged, unmet, anchored to a cost frame shaped by PayU/Adyen flat rates. Biggest single deal risk. Plan: reach him by day 21 via Sofia, with a total-economic-value model.
Decision criteria	IN PLAY	Not yet fixed – Sofia wants approval rates, David wants cost, Marcus wants fewer vendors. Whoever writes the criteria wins. Our job: get 'recovered revenue' and 'routing neutrality' onto the scorecard before Adyen fixes it as 'price + vendor count'.
Decision process	UNKNOWN	Sign-off chain, board involvement, procurement gates – all unconfirmed. Discovery call one item.
Identify pain	STRONG	Declining approvals (Brazil -6pp, Mexico -5pp), 7-month method rollouts, cross-border cost drag, poor developer experience. Felt, measured, and on record.
Champion	MODERATE	Sofia – motivated, data-driven, personally measured on revenue recovery. But 14 months tenure and 'is Yuno too young?' doubt. Needs arming, not just agreement.
Competition	ACTIVE	Adyen (champion: Marcus, story: consolidation) + PayU renewal (story: cheapest path of least resistance). Both are acquirers selling their own rails – our structural wedge.

Two elements missing means this is not yet a deal – it's a well-qualified opportunity. The 90-day plan below is built to close the Economic Buyer and Decision Process gaps inside the first three weeks.

Priority call: Must-Win

Fit: 56% of TPV (\$236M) sits in Brazil, Mexico and Colombia – the exact markets where Yuno's connectivity and published results (inDrive 90% approval, Reserva +4pp in three months, Livelo recovering 50% of failed transactions) are strongest. Logo value: a healthcare SaaS reference beats another marketplace logo, and validates Yuno in Southeast Asia and Africa where the company is expanding. Revenue: ~€120K/yr recurring at Phase 1 volumes, with built-in expansion as tiers fill, tokens and 3DS attach, and new markets add transactions. The walk-away condition is narrow: if David hard-gates on lowest headline acquiring rate with no interest in total economic value, we pass – Yuno doesn't sell acquiring rates, and shouldn't fight a rate war it isn't even a participant in.

What the dossier doesn't tell us — and how we close each gap

Unknown	Why it matters	How we get it
HealthBridge's take-rate on the \$420M patient TPV	Determines whether recovered volume is direct P&L or a client-retention lever – changes how the model is framed to David	Direct question to Sofia, discovery call one
Regional payment-method mix	The 82% card / 18% APM split is global only; regional mix sizes the local-method upside per market	90-day transaction export under NDA
Chargeback and fraud rates	Material to any 3DS/routing recommendation and to Marcus's reliability concerns	Same data export
PayU termination terms	Notice periods and exit fees decide whether a clean 89-day transition is real	Sofia, week one
Adyen's full terms beyond 2.8% + \$0.25	Headline RFP rates rarely survive contracting – settlement timing, lock-ins, minimums all unknown	Calibrated question to Sofia: 'What has Adyen shown you beyond the rate?'
Recurring/membership billing share of TPV	Sizes the Card Account Updater opportunity precisely instead of directionally	Discovery call one

The Sofia–David conflict is the deal

Sofia is measured on revenue recovery; David has demanded 20% cost reduction. Most sellers will pick a side. The winning move is to refuse the trade-off: position the decline leakage itself as a cost line. \$18M a year in failed legitimate payments is the largest single 'cost' in HealthBridge's payment stack – bigger than the entire \$14.8M processing bill. Presented that way, Sofia's agenda becomes the fastest route to David's number, and the two mandates stop competing. That reframe is the strategic spine of Part B.

2. Stakeholder Engagement Strategy

Each stakeholder gets a four-layer read – stated position, actual incentive, pressure source, and the exit that lets them say yes without looking weak – plus scripted tactical empathy: the label that shows we've heard them, and the calibrated question that moves them. We never sell to layer one. We always solve layer four.

Persona	Core need	Yuno value proposition (theirs, not ours)	One line that lands
Sofia Mendez VP Payments	Approval-rate recovery; 8 local methods in 2024; consolidation story	Cascading + smart routing over her existing providers from day one, plus pre-built local connectivity in her exact markets	"You get to 78% region by region, on rails that already exist – not on a roadmap."
Marcus Chen Head of Eng.	Protect 45-person team; fewer integration surfaces; API reliability	One API abstracts every provider – integration surfaces shrink even as commercial options grow; no rip-and-replace	"This is a subtraction from your backlog, not an addition."
David Park CFO	20% cost cut; board-defensible payback	The \$18M decline leakage reframed as his largest payment cost line; one transparent platform fee, no hidden blended margin	"Your biggest payments cost isn't your MDR. It's the revenue that never arrives."
Jessica Wu CEO	Patient access; team focus; emerging-market growth	Every recovered decline is a patient who completed a payment for care	"This is an access project before it's a cost project."

Sofia Mendez — build the case with her, and only her, first

Ex-PayPal, data-driven, impatient with fluff, personally measured on revenue recovery. Stated position: 78% approval and four methods in Q1. Actual incentive: her modernisation mandate needs a visible, numbers-backed win in year one of a 14-month tenure. Pressure: David's cost bar squeezing her roadmap; Marcus's Adyen preference undermining her vendor authority. Her exit: a decision she can defend to David and Jessica as financially rigorous, not as her pet project.

Label: "It sounds like you've already done the maths on what these declines are costing you, and what's been missing is a partner who'll commit to numbers rather than roadmaps."

Calibrated question: "If we hit 72% in Brazil by the end of Q1, what does that do for the conversation you're having with David?"

Arm her, don't just convince her: she carries this internally when we're not in the room. Give her the benchmark table, the region-by-region lift plan, and the reference calls (Reserva, Livelio) – material she can forward, not slides she has to defend.

Marcus Chen — the objection to dissolve, not the champion to flip

Ex-Google, 45 engineers stretched across 15+ integrations, currently Adyen's internal advocate because consolidation sounds like less work. Stated position: why a third vendor. Actual incentive: bandwidth protection and not owning a failed migration. Pressure: leadership expects Southeast Asia and Africa expansion without his roadmap moving. His exit: a technical decision he can defend to his own team, with a proof point before a signature.

Label: "It seems like the last thing your team needs is another integration project sold to you by someone who won't be there when the webhooks start failing."

Calibrated question: "How are you planning to add PSE, GCash and M-Pesa on the current stack without it landing on your roadmap?" — the honest answer is months of provider-by-provider integration work, which is the case for one abstraction layer.

Sequencing rule: Sofia pre-briefs him; Yuno Solutions Engineering runs his session, not sales; sandbox access before any commercial ask. His PayU complaint is documentation and webhook reliability – meet him exactly there.

David Park — sold separately, with a number that survives the board

Ex-McKinsey, numbers-first, unengaged so far, anchored to a 20% frame the incumbents shaped. Stated position: cut payment costs 20% or why bother. Actual incentive: the 18-month profitability target the board tracks. His exit: a payback case he can defend without becoming the executive who personally picked a payments vendor.

Label: "It sounds like payments has only ever been presented to you as a cost line to shrink – never as a revenue line that's leaking."

Calibrated question: "What happens to the profitability plan if approval rates keep sliding at the rate they did last half?"

The framing that wins: we don't promise his 20% on the acquiring line – Yuno doesn't price that line at all and says so plainly. We show the leakage as the bigger cost, the platform fee as the only new cost, and the payback in months, with ranges rather than point estimates. Honesty about the 20% gap is the credibility play: he has heard inflated numbers before and will again.

Jessica Wu — held in reserve

Engage only if this escalates to board level, and only with Sofia's agreement on timing. The single message: failed payments are failed access to care. One sentence, mission-framed, then stop talking.

Champion and co-presentation plan

Weeks one and two belong to Sofia exclusively – she owns the internal narrative before anyone else sees a slide. Technical architecture is co-presented to Marcus by Yuno Solutions Engineering. The financial model is co-presented to David with Sofia in the room and a Yuno commercial lead alongside me, so the numbers read as institutional, not personal. Jessica only ever hears the mission frame, and only if needed.

4. Objection Handling

Each response runs the same discipline: label the concern first (empathy is a tactic, not a courtesy), answer it with substance, then reframe to ground we win on. Never answer the first objection with a rebuttal.

Marcus: “Why add Yuno on top of our existing PSPs? Why not just consolidate everything into Adyen?”

“It sounds like the real concern is integration surface area, not vendor count on a slide – and that's the right concern. Yuno doesn't add a provider, it abstracts them: your team integrates one API and one webhook contract, and PayU, Stripe and any future provider become configuration, not code. Consolidating into Adyen makes the router and the acquirer the same company – when Adyen decides where a transaction goes, it's also deciding what Adyen earns, and routing volume to yourself isn't orchestration, it's distribution. I'd rather your engineers pressure-test that in a sandbox than take my word for it.”

David: “Your pricing looks similar to PayU's. How do we save money if we're adding a layer?”

“It seems like the comparison you've been shown puts us in the same column as PayU – so let me correct the category first: Yuno has no acquiring rate. You negotiate acquiring directly with your providers; our fee is a fixed €0.03 per transaction plus €3,000 a month – around €120K a year with a commitment discount, never a percentage of your volume, no blended margin. By Sofia's own estimate you're losing \$18M a year to declines – larger than your entire processing bill – and stopping that leak is precisely what the fee buys. The question for your board isn't 'which rate is lowest', it's 'which structure stops the leak’.”

Sofia: “Yuno is a lot younger than Adyen. How do I know you'll still be around in 3 years?”

“That's a fair question, and if I were putting my name on this decision I'd ask it too. Yuno's Series A closed in 2024 led by DST Global with a16z, Tiger Global, Kaszek and Monashees returning from seed – early investors doubling down – and the team built payments at Rappi, so your LATAM complexity is our founding DNA, not an expansion market. Structurally, we never hold your funds and hold no acquiring licences, so you're not exposed to our balance sheet the way you are to a PSP's. If you ever walked away, your acquiring relationships walk with you – that's the safest architecture on your shortlist, not the riskiest.”

Marcus: “Our engineering team is slammed. We can't take on a 6-month integration project right now.”

“It sounds like you've been through a migration that was sold as easy and wasn't – PayU took seven months to deliver one payment method, so scepticism is earned. Phase 1 connects Yuno alongside PayU and Stripe exactly as they run today: nothing ripped out, routing and fallback live above them, provider connectivity maintained by us. The six-month rip-and-replace in your busiest quarter is the Adyen consolidation path, not this one. Let's scope sandbox-to-production with your team before anyone signs – I'd rather lose a week now than slip a month later.”

5. 90-Day Deal Plan

Days	Milestone	Exit criteria
1–7	Discovery with Sofia: take-rate, regional method mix, chargeback data, PayU exit terms, decision process. SE assigned.	MEDDICC gaps D and E closed; data export agreed
8–21	Technical session with Marcus's team, run by Solutions Engineering. Sandbox live. Phase 1 jointly scoped.	Marcus neutral-to-positive; sandbox in his team's hands
15–30	Financial model validated with Yuno commercial desk; proposal presented to Sofia + David together.	David engaged; decision criteria include recovered revenue
30–45	Reference calls (Reserva, Livelo profile matches). Security and compliance review.	Champion armed; no open technical vetoes
45–60	Commercial negotiation and redlines; HealthBridge internal sign-off sequence runs.	Verbal commit; contract in legal
60–75	Signature target — two-week buffer before day 89. Migration kickoff.	Signed; integration started
75–89	Yuno live alongside PayU and Stripe; routing and fallback active on first corridors.	First transactions orchestrated before PayU decision deadline

Resources needed from Yuno

- A named Solutions Engineer from day one – Marcus is won or lost on technical credibility, not narrative.
- Executive sponsor (VP+) for the David and Jessica conversations.
- Matched references – Reserva or Livelo for approval-rate proof; one multi-country enterprise logo for longevity.
- Sandbox inside two weeks; pricing-desk sign-off on the platform fee quoted in Part B.

Win strategy vs Adyen

Refuse their battlefield. Adyen wants this decided on brand, headline rate and vendor count – ground where scale wins. We move it onto approval-rate economics, routing neutrality and migration risk – ground where structure wins. Three moves: (1) reach David with the leakage-as-cost frame before Adyen's rate anchors him; (2) hand Marcus the honest engineering comparison – Yuno alongside the current stack versus a dual rip-and-replace in a busy quarter; (3) plant one structural question we're happy to have asked of everyone: “whoever routes your transactions – ask what they earn when the answer is 'to ourselves'.” Never disparage Adyen; they're credible, which is exactly why the conflict-of-interest point lands harder made calmly.

Top three loss risks and mitigations

Risk	Signal to watch	Mitigation
Marcus drives an Adyen recommendation before we reach the table	Technical evaluation scheduled without Yuno invited	Week-one SE session; sandbox before commercials; make it a live-code evaluation, not a deck war
David anchors on lowest headline acquiring rate	“Just send your rates” style procurement requests	Pre-empt with the leakage-as-cost model by day 21; never submit a rate card – we don't have one, and that's the point
PayU defensive discount muddies the water late	Renewal offer suddenly improves near day 60	Concede it early with Sofia: PayU will cut price, and a discount fixes nothing about 68% approval in Brazil

Recovering Your Lost Revenue

Prepared for Sofia Mendez, Marcus Chen and David Park · HealthBridge Global

3. Commercial Proposal & Financial Impact Model

What's broken, why it matters, and the simplest way to fix it

HealthBridge processes \$420M of patient payments a year at a 72% blended approval rate. Twenty-eight of every hundred legitimate patient payment attempts fail. In your two largest growth markets the trend is the wrong direction – Brazil has fallen from 74% to 68%, Mexico from 76% to 71% – and your current provider's answer is that nothing can be done. Your own estimate puts the leakage at \$18M a year: more than your entire \$14.8M processing bill. Meanwhile, adding a single payment method takes seven months, and most of your LATAM volume is processed cross-border through a European entity, carrying interchange and FX costs that local processing would not.

The simplest viable fix is not another migration. It is one orchestration layer that sits alongside the providers you already have – PayU and Stripe keep processing exactly as today – and takes over the decisions above them: which provider gets each transaction, what happens when a payment declines, and how patients in each market get to pay the way they actually pay.

What Yuno is — and, deliberately, what it is not

Yuno is an agnostic payments orchestration layer. We are not a PSP and not an acquirer. We hold no acquiring licences, never touch your settlement funds, and earn nothing from where a transaction is routed. Your acquiring contracts, rates and relationships stay yours, negotiated directly with your providers – we are not a party to them and quote no acquiring pricing in this proposal. That neutrality is not a legal footnote; it is the product. A provider that both routes transactions and earns acquiring revenue on them is choosing between your approval rate and its own margin on every payment. We never face that choice, because routing decisions are the only thing we do – and you set the rules they follow.

Capability	What it does for HealthBridge
Smart routing	Every transaction goes to the provider most likely to approve it at the best cost for that market, method and moment – your rules, tested and tuned with live data, not a processor's defaults
Cascading / fallback	A decline at one provider is retried with another in milliseconds. Today a PayU decline is simply a lost patient payment – there is nowhere else for it to go
Local processing, native methods	Patients pay how they actually pay: PIX and Boletão in Brazil, OXXO in Mexico, PSE in Colombia, GCash and Maya in the Philippines, M-Pesa in Kenya – processed in-country, in local currency, cutting the cross-border interchange and FX drag your LATAM volume carries today
Card Account Updater & universal tokens	Stored Visa and Mastercard credentials refresh automatically when cards expire or are reissued, and network tokenisation keeps card-on-file credentials current and portable across every provider – recurring membership payments stop failing silently, and your stored cards are never hostage to one PSP's vault
Intelligent 3DS & chargeback control	3DS applied where risk or regulation demands it and stripped from trusted transactions – security balanced against friction, transaction by transaction – with liability shift where it pays and chargeback ratios held low and manageable, below scheme monitoring thresholds
Unified analytics & dashboard	Every provider, method and market in one view: approval rates, declines by reason code, cost per route. Full vendor visibility – you see exactly how each provider performs, and they know you can see it

Capability	What it does for HealthBridge
One API, 1,000+ integrations	Yuno's existing connectivity – 1,000+ payment methods and providers across 200 countries – becomes your infrastructure. Your next market entry is configuration, not an engineering project: weeks, not the seven months your last method launch took

The power dynamic this creates is the point. Today, 100% of a market's volume is captive to whichever legacy provider was integrated first, and 'it's the issuers, nothing we can do' passes for an answer. An agnostic layer inverts that: providers compete for your volume transaction by transaction, on your rules and your terms, and underperformance is visible on the dashboard the day it starts, not at renewal. We are the only party in this process with no acquiring business to protect and nothing to earn from where a transaction routes – which is what makes the inversion real rather than rhetorical. The end state is the one that matters: payments stops being a cost utility you tolerate and becomes a revenue stream you manage.

Where you stand today — benchmarked

Your approval rates, region by region, against published market reference ranges. Two caveats we'd rather state than bury: regional benchmark data varies by source and methodology (figures below draw on published industry reporting, flagged as reference ranges rather than precise standards), and every uplift target we commit to below is set conservatively beneath both the benchmark band and your own historical performance where known.

Region	Your rate	Reference range*	Your own history	Gap to close
US	86%	88–93% domestic	—	Modest – tuning, not surgery
EU (4 markets)	81%	85–90% domestic	—	Moderate
Mexico	71%	70–85% (LATAM band)	76% six months ago	You've proven 76% is achievable – you were there
Brazil	68%	70–85% (LATAM band)	74% six months ago	Largest single opportunity: \$130M market, 6pp below your own high-water mark
Colombia	66%	70–85% (LATAM band)	—	Below the bottom of the band
SE Asia	63%	75–88% (APAC band)	—	Wide – local methods (GCash, Maya) are the lever, not card tuning
Africa	58%	No reliable published band	—	M-Pesa and local rails are the path; card-rate comparisons mislead here

**Reference ranges compiled from published payment-industry benchmark reporting; treated as directional context, not contractual baselines. What we commit to is the lift plan below – built from your data and our published results, not from the bands.*

The recovery model — shown in full, assumption by assumption

Method: your approved volume divided by your approval rate gives attempted volume; attempted volume multiplied by the percentage-point lift gives recovered volume. Same logic as Sofia's own \$18M estimate – our assumptions are deliberately tighter than hers, and each one is anchored to either your own history or a published Yuno customer result (Reserva +4pp in three months; Livelo, 50% of failed transactions recovered; inDrive, 90% approval sustained).

Region	Approved vol.	Rate	Attempted vol.	Committed lift	Recovered / yr	Anchor for the assumption
Brazil	\$130M	68%	\$191.2M	+4pp → 72%	\$7.65M	Reserva case (+4pp/3mo); still below your own 74%
Mexico	\$72M	71%	\$101.4M	+3pp → 74%	\$3.04M	Partial recovery toward your own 76%

Region	Approved vol.	Rate	Attempted vol.	Committed lift	Recovered / yr	Anchor for the assumption
Colombia	\$34M	66%	\$51.5M	+3pp → 69%	\$1.55M	Local processing + first PSE rollout
SE Asia	\$22M	63%	\$34.9M	+3pp → 66%	\$1.05M	GCash/Maya wallet rollout
Africa	\$10M	58%	\$17.2M	+3pp → 61%	\$0.52M	M-Pesa rollout – least-evidenced line, flagged as such
US	\$98M	86%	\$114.0M	+1pp → 87%	\$1.14M	3DS and retry tuning only
EU	\$54M	81%	\$66.7M	+1pp → 82%	\$0.67M	As US
TOTAL	\$420M	72%	\$576.9M	+1 to +4pp	\$15.62M	13% below your own \$18M estimate

Total modelled recovery: \$15.6M a year – set 13% below your own internal estimate on purpose. If we are wrong, we have built the model to be wrong in your favour. One honest qualifier: this is recovered patient payment volume. How much lands on HealthBridge's own P&L depends on your facilitation take-rate, which we don't yet know – and what doesn't land on your P&L lands on your hospital clients' collections, which is a retention argument for your \$42K-average contracts rather than a revenue line. We'd size both precisely in discovery.

Because a single point estimate invites a single point of attack, the model carries an explicit range:

Scenario	Recovered volume / yr	Basis
Conservative	\$9–10M	Lifts land at roughly 60% of the committed targets across all regions – the outcome if execution disappoints everywhere at once
Base (modelled above)	\$15.6M	Region-by-region lifts anchored to your own history and published Yuno customer results
Upside	\$18M+	Sofia's own internal estimate – approached if regions close fully to benchmark bands and local methods land on schedule

Cross-border friction — the cost lever you control

Most of your LATAM volume is processed cross-border today, which attaches non-domestic interchange, scheme cross-border fees and FX spread to every transaction – and depresses approval rates, because issuers systematically trust domestic transactions more. Yuno's role is connectivity and routing: we put in-country processing options for Brazil, Mexico and Colombia on your table through connections that already exist on our platform, route each transaction domestically where that wins, and give you the per-route cost visibility to negotiate every provider relationship from strength. The rates themselves are yours to negotiate directly with those providers – we don't set them, don't mark them up, and don't quote them. What we remove is the structural reason you were paying cross-border premiums on domestic patients' payments in the first place, and the blindness that made it hard to see.

3DS and chargebacks — friction where it earns its keep, nowhere else

Blanket 3DS is how approval rates die politely; no 3DS is how chargeback programmes begin. We run it as a strategy, not a switch: trusted, low-risk transactions flow frictionless using exemptions where regulation allows, while higher-risk and SCA-mandated volume is authenticated, taking the liability shift where it pays you. Friction comes off transactions that were never going to be fraudulent – approval rate recovered and revenue recognised in-quarter – while your chargeback ratio stays low, manageable and below the schemes' monitoring thresholds. At the \$15–25 you pay per chargeback today, every dispute prevented is money twice: the transaction kept and the penalty avoided. We build the initial rules with your fraud data in discovery, then tune them monthly against your approval-rate targets.

Operational impact

- **Method launches in weeks, not months:** Boleto, PSE, GCash, Maya and M-Pesa are existing Yuno connections – your Q1 method roadmap becomes configuration on our side rather than a seven-month integration on yours. Approval-rate benefit in those markets pulls forward by roughly a quarter.
- **Your payments team stops reconciling by hand:** four FTEs currently stitch together reconciliation, disputes and failed-payment recovery across two disconnected providers. One dashboard and one reporting layer conservatively frees a quarter to half an FTE for the work you actually hired them for – and that saving compounds with every provider and method you add.
- **Engineering effort goes down, not up:** one API and one webhook contract, with provider connections maintained by us. The integration your team was quoted six months for is not this project.

Pricing — the only numbers in this proposal that are ours

Everything below is Yuno's pricing and only Yuno's: the orchestration platform, universal (network) tokenisation, and 3DS authentication. There is no acquiring rate anywhere in it, because we don't sell one – your acquiring economics stay yours, negotiated directly with your providers. Two structural choices are deliberate. First, we never take a percentage of your volume: orchestration is a fixed euro-cent price per transaction plus a flat €3,000 monthly platform fee, so as your TPV grows, our fee per dollar processed falls automatically – your growth is never our margin. Second, the per-transaction price is tiered downward on volume: the more you route, the less each transaction costs. All tiers are illustrative pending commercial confirmation.

Monthly orchestrated volume	Orchestration (per txn)	Universal tokens (per active token / mo)	3DS authentication (per auth)
Tier 1 · up to 250k txns	€0.035	€0.030	€0.025
Tier 2 · 250k–500k txns ◀ HealthBridge today	€0.030	€0.025	€0.020
Tier 3 · 500k–1M txns	€0.025	€0.020	€0.015
Tier 4 · 1M+ txns	Custom – priced with our commercial desk	Custom	Custom

Platform fee: €3,000 per month (€36,000 a year), covering the unified dashboard and analytics, provider connection maintenance, and routing-rule support. No setup fee, no percentage of volume, nothing earned from routing outcomes.

Committed-volume incentive: agree a minimum monthly transaction volume and the orchestration line drops a further 15%. On your Phase 1 volume (~3.29M transactions a year, ~274k a month – Tier 2 at €0.030): orchestration ~€98,700 a year, or ~€83,900 with the volume commitment, plus the €36,000 platform fee – approximately €120,000 all-in per year. As Phase 2 brings your full estate across and Southeast Asia and Africa add volume, you move down the tiers automatically: the unit price falls exactly when your volume rises.

	Annual figure	Whose number it is
Yuno total fee (Phase 1, Tier 2, 15% volume commitment + platform fee)	~€120K	Yuno's – quoted here, fixed and disclosed
Modelled recovered payment volume	\$15.6M	Yours – built from your data, committed conservatively
Acquiring-cost improvement from domestic processing and routing competition	Negotiated by you, directly with providers	Yours – we enable it, we don't price it
Operational and speed-to-market value	\$0.4M–\$0.65M	Yours – freed FTE time plus a quarter's pulled-forward method revenue

	Annual figure	Whose number it is
Chargeback fees avoided (\$15-25 per dispute prevented)	Sized in discovery with your dispute data	Yours – strategy included in the platform fee

Now read the first two rows together, because this is the whole commercial case: roughly €120K of fee against \$15.6M of conservatively modelled recovery – on the order of \$120 of recovered patient payment volume for every dollar of fee (at ~\$1.08/€), with the entire annual fee covered by the first three days of a typical month's recovery. Even if our model over-promises by two-thirds, the platform pays for itself roughly forty times over in year one. Your current stack costs you ~\$14.8M a year and leaks \$18M more; this layer costs ~€120K and exists to stop the leak. That is the shape of decision we want you to hold us to – and why we propose success criteria written into the agreement: regional approval-rate targets, reviewed monthly, on the dashboard where everyone can see them. A cost utility asks you to trust it. A revenue stream shows you the number.

Why this, and why now

You have 89 days of contract runway and three options. Renew PayU and keep the leak. Consolidate into a single acquirer-router and trade one captivity for another – with a rip-and-replace migration in your busiest quarter. Or put an agnostic layer above the stack you already trust, keep every existing relationship, and make your providers compete for every transaction. We are proposing the only option that requires you to remove nothing, and the only one where the party making routing decisions has no stake in the answer. Phase 1 goes live alongside PayU and Stripe with routing, cascading and the unified dashboard; Phase 2 – local processing depth, the full Q1 method rollout, Card Account Updater across your recurring base – follows on rails that already exist. The next step is a 45-minute working session with your data: we will show you, market by market, exactly where the first four points of approval rate come from.

Appendix — Assumptions, Verification Status & Sources

Verification framework applied

Claim	Status
Yuno funding (seed \$10M 2022 a16z-led; Series A \$25M Mar 2024 DST-led, ~\$150M valuation)	Verified – TechCrunch, Forbes
Yuno case results: inDrive 90% approval; Reserva +4pp/3mo; Livelu 50% failed-txn recovery; 1,000+ methods, 200 countries	Verified – y.uno published pages
Yuno capabilities: smart routing, PSP fallback/retry, Card Account Updater (Visa & Mastercard), provider-agnostic positioning	Verified – y.uno product pages and docs
Regional approval-rate reference ranges (US 88–93%, EU 85–90%, LATAM 70–85%, APAC 75–88%)	Likely (70%) – published industry reporting, vendor-compiled; primary-source regional splits from card networks are not public
Local acquiring uplift magnitude	Uncertain – published claims exist but lack methodology; our lift model deliberately anchors to HealthBridge's own history and Yuno cases instead
Involuntary churn materiality for recurring billing (published estimates range ~25–50% of total churn)	Likely (75%) – Recurly/Paddle data, ranges conflict across sources; directionally solid, precision low
Yuno tiered pricing (fixed per-txn orchestration, universal tokens, 3DS), €3K/mo platform fee and 15% committed-volume discount	Illustrative structure – requires Yuno pricing-desk sign-off before customer presentation; tier breakpoints and unit rates are placeholders for the commercial desk
All HealthBridge figures (volumes, rates, costs, quotes)	Dossier-sourced – note the dossier's \$14.8M 'estimated' cost differs ~\$0.28M from a bottom-up build of its own stated rates; flagged, not smoothed

Open items that change the model

- HealthBridge's take-rate on patient TPV (changes how recovery lands on their P&L).
- Regional payment-method mix; chargeback and fraud rates; recurring/membership share of TPV.
- PayU termination terms; Adyen's full contract terms beyond the headline rate.
